

I think EdWin is the winner in the price-performance test compared to other CAD/CAE tools. It was very early with the superb solution with a common database for both schematic and layout. The possibilities of EdWin is great, it has a lot of features that you will not find in other low priced systems. It's great capability is one of the reasons that I use EdWin, I know that I will not be limited by the tool.

But the maybe best with EdWin is the great support given by the people in India. I have so far not seen such a great support! Another very important thing is the possibility to influent the development progress of the tools. The great support gives the customers a close contact with the developers and that makes it possible to give suggestions for new features.

When I started to use EdWin I came from the military industry and I was very surprised of the possibilities with EdWin. It is very clear that it is a very mature package. I have so far designed more than 40 boards with this package and I have always been satisfied.

My prime usage is development of very small and compact boards and therefore I do a lot of manual routing. With the latest updates EdWin have made leap forward and made it even simpler and faster to work with.
